## **CLAIMS**

What is claimed is:

1. Wireless apparatus for communicating with a remote location through a wireless network, comprising:

first and second units each having a low-power transceiver for wireless communication over a low power radio link;

said first unit having a second transceiver for wireless communication with said remote location, said second transceiver having a transmission range greater than said low-power transceiver;

said second unit being smaller than said first unit and being of a size so as to be worn or carried on the body of a user;

said second unit having a key pad for inserting calling data;

a display in said second unit displaying calling data;

said second unit having a microphone for converting speech into electrical signals and a speaker for converting electrical signals into speech and a controller for controlling operations of said display, speaker and microphone and coupling electrical signals to the low-power transceiver in said second unit for transmission to said first unit through said low-power radio link.

- 2. The apparatus of claim 1 wherein said first unit comprises a controller for transferring signals received by the low-power transceiver in said first unit to said second transceiver for transmission to said remote location.
- 3. The apparatus of claim 1 wherein the controller in said first unit further includes means for transferring signals from said second transceiver to the low-power transceiver in said first unit for transmission over said low-power radio link to said second unit.

- 4. The apparatus of claim 1 wherein said low-power transceivers both operate at a specific carrier frequency to prevent receipt of a transmission from a transmitter other than the low-power transceivers in said first and second units.
- 5. The apparatus of claim 1 wherein the transmission range of said low-power transceiver is less than 100 feet.
  - 6. The apparatus of claim 5 wherein the transmission range is less than 20 feet.
- 7. The apparatus according to claim 1 wherein the first and second units are powered by portable batteries, a battery source in said second unit being smaller and lower powered than the battery source in said first unit to reduce the overall size of said second unit.
- 8. The apparatus according to claim 1 wherein said low powered transceivers encode their transmissions to prevent interception by other transceivers.
- 9. The apparatus according to claim 1 wherein said second transceiver is a digital wireless transceiver.
- 10. The apparatus according to claim 1 wherein a key pad and display are eliminated from said first unit to reduce electronic components employed in said first unit.
- 11. The apparatus according to claim 1 wherein said microphone and speaker are combined into one unit.

- 12. The apparatus according to claim 1 wherein a stylus is provided for operating said key pad.
  - 13. The apparatus of claim 1 wherein the second unit is worn on a wrist of the user.
- 14. The apparatus of claim 1 wherein the second unit is affixed to an article of clothing of the user.
- 15. The apparatus of claim 1 wherein the second unit is of a size to enable it to be placed with a pocket of an article of clothing of the user.
- 16. The apparatus of claim 1 wherein the first unit is maintained at a greater distance from the user's head than said second unit to reduce possible harm due to radiation emitted by said first unit.
